

1. **Introduction**

The purpose of this study is to investigate the effects of the proposed system on the performance of the participants.

The study was conducted in a controlled environment with a sample of 30 participants.

The participants were divided into two groups: the control group and the experimental group.

The control group received the standard training, while the experimental group received the proposed system.

The results of the study show that the proposed system significantly improved the performance of the participants.

The improvement was observed in both the short-term and long-term performance.

The proposed system was found to be more effective than the standard training.

The study also found that the proposed system was more cost-effective than the standard training.

The results of the study suggest that the proposed system should be implemented in the future.

The study was limited by the sample size and the controlled environment.

Further research is needed to confirm the results of the study.
